

Breast Cancer Averted: Thermography Before and After Pictures

As many of you know, a good friend of mine passed away from breast cancer a few weeks ago. Needless to say, breast cancer has been on my mind. I was chatting with another friend about it recently. My friend, who shall remain nameless (because who wants everyone to see their boobie photos on the internet?), told me she had gone for a thermography session. She said that the first session showed pre-cancerous activity — or something to that effect (I don't know the actual terminology she used). Here are her before and after photos. She also describes what she did to avert breast cancer:

Thermography Before Photo

In the BEFORE photo, my right breast (would be the left one in the photo) shows feeder blood flow (new vessels formed to feed cancerous cell cluster). Looks like a red and yellow snake weaving across my breast.

Thermography After Photo

Three months later my AFTER photos show a dramatic cut-off of the blood flow (feeder vessels) and the blue and green coolness of my breasts and nipples are more in line with normalcy.

Protocol: Had a micro nutrient test done. My vitamin D and vitamin E levels were imbalanced so I supplemented and added cod liver oil to my daily vitamin intake.

My hormones were off when we looked at the thyroid in the thermogram report. Since estrogen dominance can cause breast cancer, so I began to use Women's Hormone Balance, iodine liquid and capsules..

My lymphatic system was stagnant and providing cellular waste material to feed cancerous cell clusters so I started drinking wheatgrass to detox my lymphatic system and I began lymphatic therapy using whole body vibration and infrared heat treatments.

The most important part of the protocol according to my doctor (and I have to agree with her) was that I HAD TO DE-STRESS!! NOW!!

I'm keeping up my new supplementation and will have another thermography session in 6 months to continue monitoring the situation, but looks like with my doctor's help I was able to nip in the bud the possibility of cancer formation.

Stress!

Oh, and I should mention... My friend who died?

She said she thought stress was the number one factor in the development of her breast cancer.

So... it's Friday. Maybe we should all take the afternoon off and go to a matinee?

How About You?

Have you tried thermography? What has your experience been with it?

What are you doing to reduce stress and prevent breast cancer?
